

## Center Support Bearings

DT Components center support bearings are available for a broad range of domestic and foreign passenger cars, SUV's, pickup trucks as well as medium and heavy duty truck applications. Each center support bearing is engineered and constructed for the specific vehicle application ensuring precise driveshaft alignment and support. All center support bearing components are manufactured at ISO9001 certified or higher factories and go through rigorous testing throughout the manufacturing process to ensure the highest possible quality is built into every unit.

The bearings contained within the center supports are designed to provide smooth and quiet operation under the harshest conditions. Every bearing is pre-lubricated for life and sealed with metal reinforced seals preventing moisture and contaminants from entering the bearing. The center support rubber cushions are manufactured using a special formula that blends the highest quality materials into a rubber compound that provides support while absorbing and isolating vibrations that could damage the driveline.

Center support frames are constructed from cold rolled steel for additional strength and feature a protective corrosion resistant coating to protect it from the elements and road salt. DT Components center support bearings are available with and without flingers where applicable.

This DT Components catalog is organized by U-Joint series and vehicle specific applications. Photos of each center support bearing are arranged in numeric order so customers can visually confirm the correct part identification before ordering. Complete interchange and vehicle application information is located in our electronic catalog that is accessible through the DT Components website.
